Introducing a revolutionary
product in nail care technology:..

CRYSTAL GLASS

- ◆ Smoother, healthier nails
- ◆ Gentle & prevents nail chipping
- ◆ Lifetime warranty on filing surface
- ◆ Hygienic & easy to clean
- ◆ Use on natural & artificial nails

Glass nail file... How is it different?

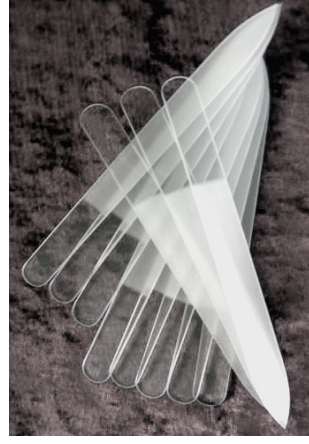

- ◆ The filing surface of the glass nail file is finely and uniformly roughened through a unique, manufacturing technique. The result?

Smother, healthier nails.

- ◆ The use of metallic or paper based nail files can cause nails to split and even with gentle and regular care they remain brittle.

Regular use of the glass nail file prevents chipping and split nails.

The filing surface of the glass nail file is created right out of the glass nail file body.

It is non-eroding, unlike paper & metallic nail files and therefore has an unlimited life span.

Properties...

- ◆ The glass nail file is made from crystal and is non-porous. This means that they cannot absorb water and form an environment for bacteria or fungus from this.
- ◆ Glass nail files are hardened at the last stage of production and this increases mechanical firmness and resistance compared to ordinary glass objects.
- ◆ Glass nail files do not break when dropped onto most surfaces (carpet or wood floors). They can break if they fall onto harder surfaces (ceramic, concrete, stone) from a height of one & half metres or more.

How to clean them...

- ◆ To keep nail files clean & hygienic, rinse under running water after each use. To clean dirtier nail files, just use a brush with a mild detergent.
- ◆ Sterilize with either heat (upto 250 C), boiling water, UV lighting or alcohol

Glass nail file safety...

- ◆ If the nail file becomes damaged it is essential to stop using it to prevent injury. Even a slight lesion reduces its effectiveness.
- ◆ Young children must be supervised by an adult when using the glass nail file.
- ◆ When not in use the glass nail file should be kept in its protective sleeve.
